Prostate cancer is one of the most commonly diagnosed malignancies in older men. The detection of prostate cancer may be problematic because of the lack of specific diagnostic markers. We have investigated the utility of a novel marker, myogenin, for the diagnosis and prognosis of prostate cancer. To evaluate the

expression of myogenin in prostate tissues and its potential clinical usefulness. Myogenin immunohistochemistry was performed in 10 radical prostatectomy specimens with prostatic intraepithelial neoplasia, 8 specimens with prostatic adenocarcinoma, 11 specimens with benign prostatic hyperplasia (BPH), and 10 prostatic needle biopsy specimens with and without an associated cancer. Myogenin expression was also investigated in benign and malignant prostate cell lines by Western blot analysis. Western blot analysis confirmed the specific expression of myogenin in the benign cell lines, LNCaP, DU145, and PNT1A. In contrast, no myogenin expression was detected in the malignant cell lines, PC3 and DU145. In the prostate tissue sections, myogenin was expressed in the cytoplasm of epithelial cells in all the tissue specimens with prostatic intraepithelial neoplasia, adenocarcinoma, and BPH. The intensity of myogenin staining correlated with increasing prostate cancer progression. In patients with a Gleason sum of 6, 7, or 8, 4 of 4, 3 of 5, and 2 of 5 had a f3e1b3768c
